

Dear Expleo hiring team,

I am applying for the Data Engineer position in Toulouse. With two years of experience building cloud data pipelines and analytics products, I would bring a practical combination of Python, SQL and reliable data delivery to your aerospace-focused Products Systems Engineering team.

At Northwind Energy, I built and operated Python, SQL and Airflow pipelines integrating operational data into BigQuery. I also developed dbt transformation models with automated quality controls and monitoring, experience that would support Expleo's need for maintainable ETL solutions and dependable analytical datasets.

My work also connects engineering delivery with operational needs. I collaborated with operations and finance teams to define KPIs and deliver Looker reporting products, while my mobility analytics experience included reusable SQL datasets, pandas analyses, documented metrics and dashboard validation checks. This background would help me work with specialists to frame questions, select relevant data and turn results into clear stakeholder-facing outputs.

I would welcome the opportunity to contribute these pipeline, data-quality and analytics capabilities to Expleo's aerospace activities.

Kind regards,
Alex Morgan
