

Dear SFEIR hiring team,

I am applying for the Data Engineer position because its focus on greenfield distributed pipelines, cloud orchestration and dependable data foundations closely matches the work I want to contribute to. I bring two years of experience building cloud data pipelines and analytics products, including Python, SQL and Airflow pipelines integrating operational data into BigQuery.

My strongest evidence for SFEIR's distributed-data missions is a real-time mobility platform built with Python, Kafka and Spark. It validates, aggregates and exposes transport events for operational analytics, with replayable integration tests and event-quality metrics supporting reliable delivery. This experience would help me contribute to scalable streaming systems while keeping their outputs useful and trustworthy.

I have also developed dbt transformation models with automated quality controls and monitoring for daily datasets. In a complementary data-quality project, I automated freshness, schema and business-rule checks and defined ownership and alerting conventions. These practices provide a practical foundation for governed data that downstream analytics and AI consumers can depend on.

I would welcome the opportunity to bring this combination of cloud pipeline delivery, distributed streaming and quality-focused engineering to SFEIR's transformation projects and technical community.

Kind regards,
Alex Morgan
