

Dear SFEIR hiring team,

I am applying for the Cloud & Data Engineer role with two years of experience building cloud data pipelines and analytics products. My background in Python, SQL, dbt and BigQuery aligns closely with work that turns operational requirements into reliable, useful data platforms.

At Northwind Energy, I built and operated Airflow pipelines integrating operational data into BigQuery, developed dbt transformation models, and added automated quality controls and monitoring for daily datasets. Working with operations and finance teams to define KPIs also taught me to connect platform delivery with the questions its users need answered. This orchestration experience provides a strong foundation for working with Cloud Composer.

I have reinforced this focus through a data-quality observability project combining BigQuery and dbt with automated freshness, schema and business-rule checks, alerting conventions and traceable failure diagnostics. I would bring this practical approach to building extensible platforms that remain observable and useful as operational needs evolve.

Kind regards,
Alex Morgan
